# Background and Data

| Previous[1] | Our Study |
|---|---|
| Low Frequency (Daily) | High Frequency (5-minute) |
| Simple architecture | Recurrent Neural Network |
| Price | Price and volume |
| Simple data processing | Sophisticated feature engineering |
| Offline learning | Online learning |

- Minute-level US equity pricing and volume data since 2000, collected using Google Finance API. Processed with five-minute window.
- 50 largest stocks as ranked by market capitalization.
- Stocks are correlated, so we will use 600 dimensional lagged stock returns (50 stocks and 12 lagged returns) as raw level input data.

[1] According to a survey on the previous researches of stock price prediction [1].

# Model and Method

Our model follows the research of Chong et al.[2]:

$$\mathbf{r}_t = [r_1, r_2, ..., r_{50}]$$
$$\mathbf{R}_t = [\mathbf{r}_t, \mathbf{r}_{t-1}, ..., \mathbf{r}_{t-12}]^T$$
$$\mathbf{r}_{t+1} = f \circ \phi(\mathbf{R}_t)$$

$\phi$:

- Data $\rightarrow$ Features, e.g. mean, variance, etc.
- PCA, autoencoder, RBM, and other unsupervised learning techniques.

$f$:

- Predictor function.
- Recurrent Neural Network (RNN), state of the art for financial time series data analysis [3].

# Evaluation and Promise

THE UNIVERSITY of NORTH CAROLINA at CHAPEL HILL

- **Measurements:** normalized mean squared error, mean absolute error, root mean squared error, and mutual information.
- **Bootstrap analysis:** will be performed on assessment of the accuracy of the estimator by random resampling with replacement from the original dataset.
- **Sensitivity:** of the result with respect to each feature and each stock will also be analyzed.

We believe an accurate prediction for stock price will lay a solid ground for a successful trading strategy. It will also shed light on the research of economics, finance, behavioral science, and mathematics.

# Thanks!
